## The Audio Data Type

### Outline

---

- ◆ Basic audio concepts
- ◆ Digital audio
  - » Sampling & quantization
- ◆ Coding/Compression
  - » Generic compression algorithms
    - ❖ PCM
    - ❖ DPCM
    - ❖ ADPCM
  - » Audio-specific algorithms
    - ❖  $\mu$ -Law
    - ❖ MPEG-Audio
  - » Speech-specific algorithms
    - ❖ LPC
    - ❖ CELP

2

# The Audio Data Type

## Basic audio concepts

---

- ◆ Audio — A disturbance of the air pressure near the ear
  - » Humans can perceive changes occurring in the range of 20 - 20,000 changes (cycles) per second (Hz)
  - » Natural human voice in the range of 80 - 3,400 Hz
  - » Humans can perceive changes in magnitude of air pressure (amplitude) from 0 - 120 dB

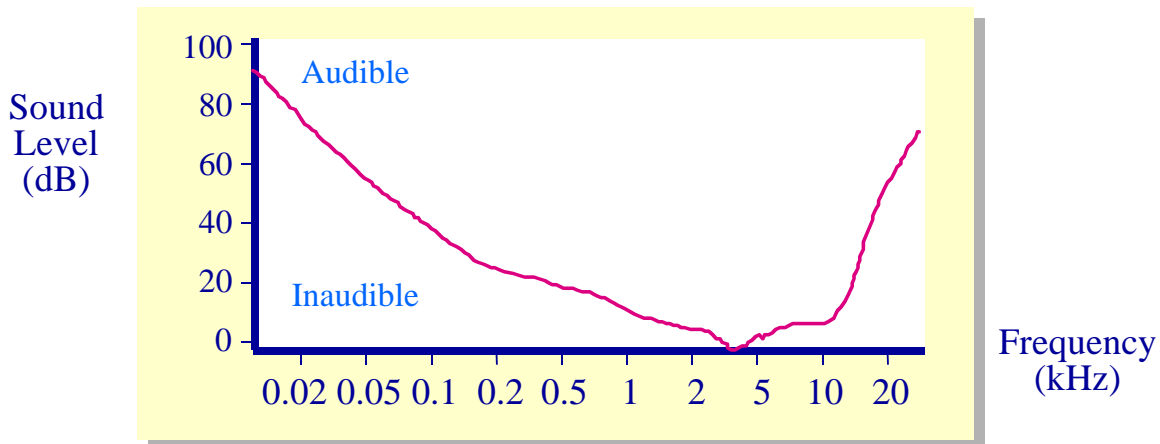

$$\text{dB} = 20 \log_{10} \frac{x}{y}$$

3

# The Audio Data Type

## Basic audio concepts

---

- ◆ Human perception of sound is a function of frequency and signal strength
  - » (Many audio coding schemes exploit this relationship.)

4

# Digital Audio

## Sampling

---

- ◆ Pulse Amplitude Modulation (PAM)
  - » Each sample's amplitude represented by 1 value
- ◆ Sampling theory (Nyquist)
  - » If input signal has maximum frequency (bandwidth)  $f$ , sampling frequency must be at least  $2f$
  - » With a low-pass filter to interpolate between samples, the input signal can be fully reconstructed

5

# Digital Audio

## Canonical sampling rates

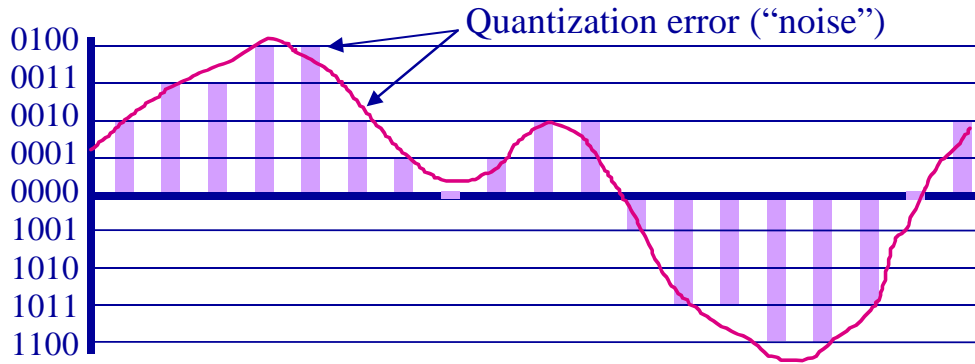

---

Format	Sampling Rate (kHz)	Bandwidth (kHz)	Frequency Range (Hz)
Telephony	8.0	3.0	200 - 3,200
Teleconferencing	16.0	7.0	50 - 7,000
Compact Disk	44.1	20.0	20 - 20,000
Digital Audio Tape	48.0	20.0	20 - 20,000

6

# Digital Audio

## Quantization & encoding

### ◆ Pulse Code Modulation (PCM)

- » Each sample's amplitude represented by an integer code-word
- » Each bit of resolution adds 6 dB of dynamic range
- » Number of bits required depends on the amount of noise that is tolerated

$$n = \frac{\text{SNR} - 1.76 - 20 \log_{10} \frac{A}{A_{max}}}{6.02}$$

7

# Digital Audio

## Canonical bit-rates

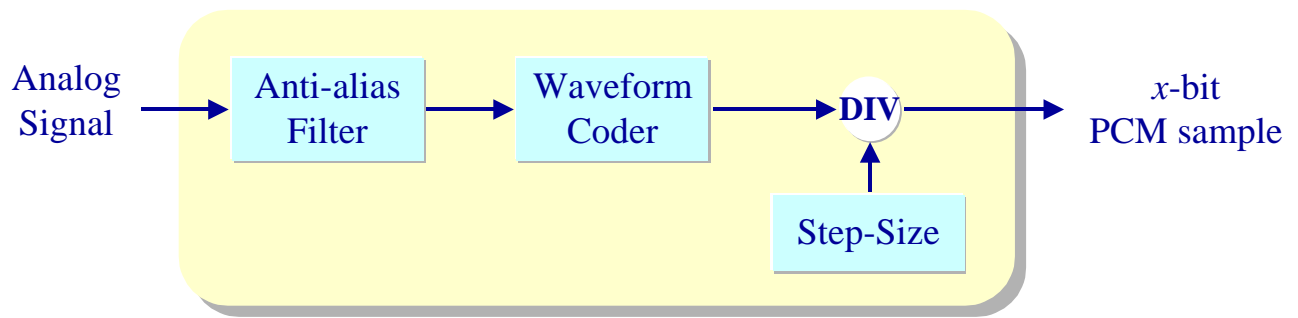

Format	Bandwidth (kHz)	Sampling Rate (kHz)	Sample Size (bits)	Dynamic Range (dB)	Bit Rates (kbps)
Telephony	3.0	8.0	8	48	64
Teleconferencing	7.0	16.0	16	96	256
Compact Disk	20.0	44.1	16	96	1,410
Digital Audio Tape	20.0	48.0	16	96	1,536

- ◆ What's "a lot" to transmit over the Internet?

8

# Digital Audio

## A linear PCM analog-to-digital coder

9

# Digital Audio

## Sampling & quantization

### ◆ Sampled input

### ◆ Decoded output

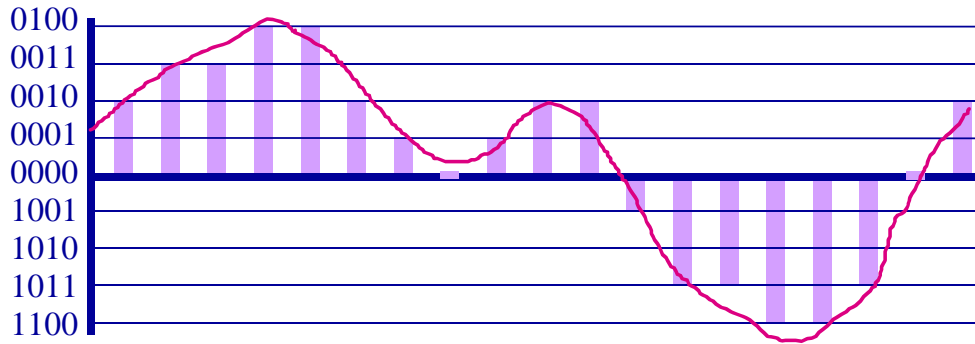

10

# Audio Compression

## Basics

---

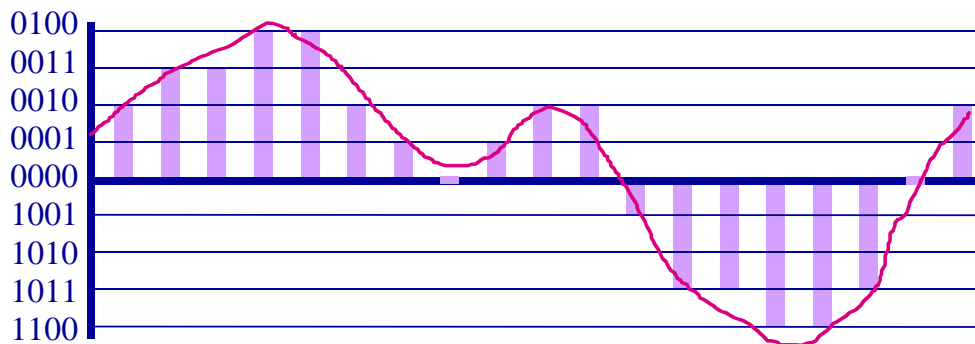

- ◆ Generic techniques
  - » Difference encodings
  - » Vector quantization
- ◆ Audio-specific techniques
  - » Transform & psycho-acoustical based encoding
- ◆ Speech-specific techniques
  - » Speech synthesis

11

# Audio Compression

## Difference encodings

---

- ◆ Differential-PCM (DPCM)
  - » Exploit temporal redundancy in samples
  - » Difference between 2  $x$ -bit samples can be represented with significantly fewer than  $x$ -bits
  - » Transmit the *difference* (rather than the sample)
    - ❖ 8-bit audio sampled at 8 kHz audio can be reduced to 56 kb/s (7 bits/sample)

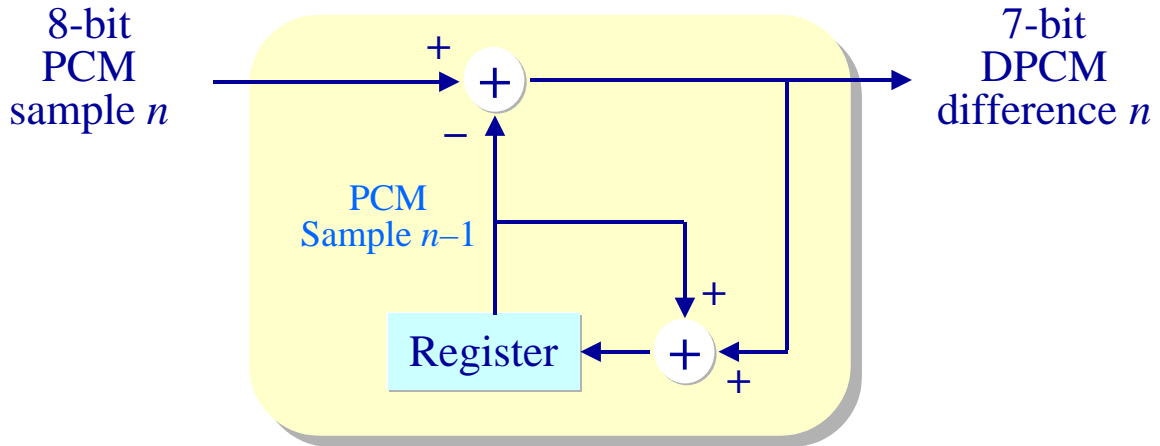

12

# Differencing Compression

## DPCM Implementation

---

- ◆ Simple to implement

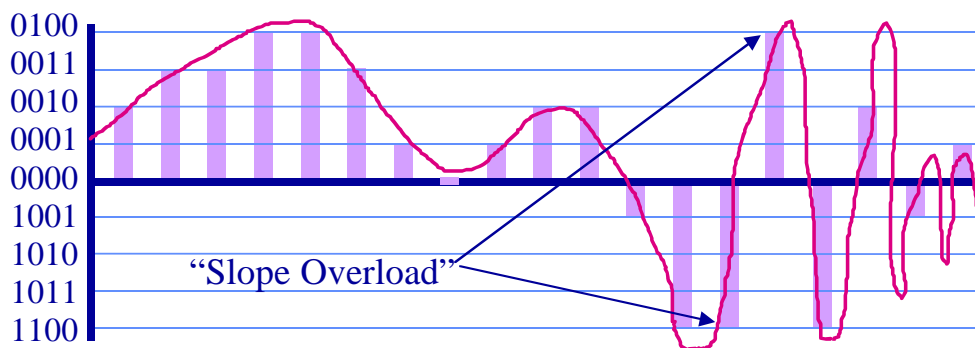

13

# Differencing Compression

## The slope overload problem

---

- ◆ Differences in high frequency signals near the Nyquist frequency cannot be represented with a smaller number of bits!
  - » Error introduced leads to severe distortion in the higher frequencies

14

# Differencing Compression

## Adaptive differential PCM (ADPCM)

---

- ◆ Use a larger step-size to encode differences between high-frequency samples & a smaller step-size for differences between low-frequency samples
- ◆ Use previous sample values to estimate changes in the signal in the near future

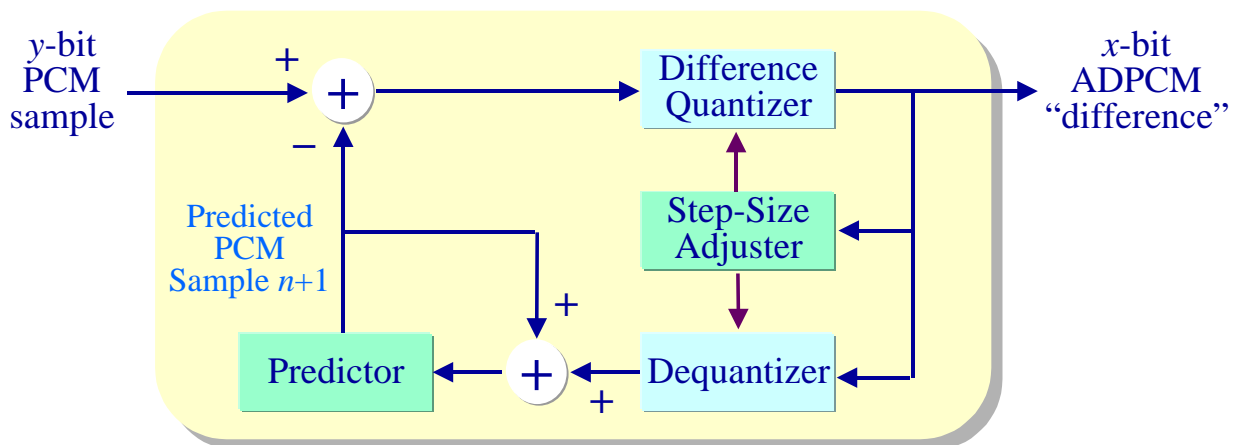

15

# Differencing Compression

## Adaptive differential PCM (ADPCM)

---

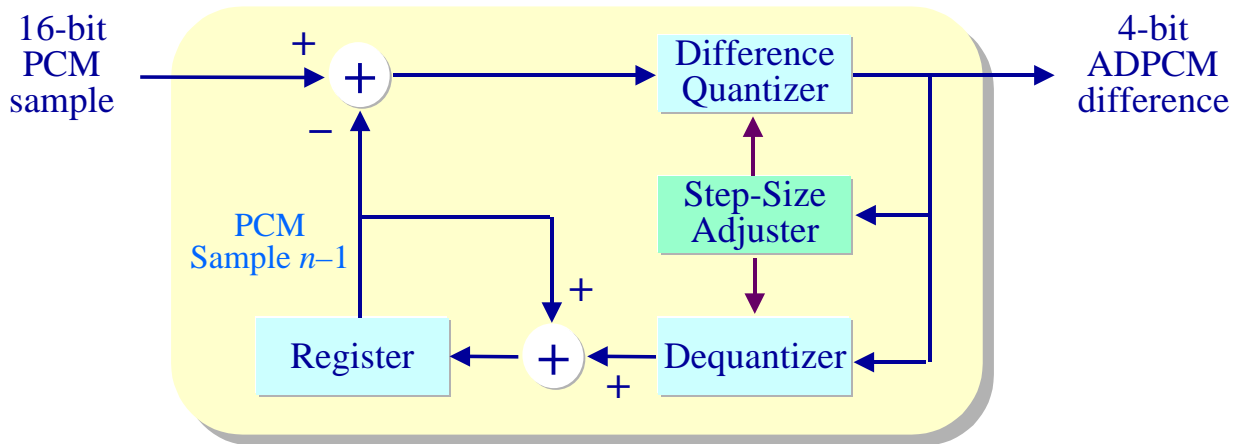

- ◆ To ensure differences are always small...
  - » Adaptively change the step-size (quanta)
  - » (Adaptively) attempt to predict next sample value

16

# Differencing Compression

## IMA's proposed ADPCM

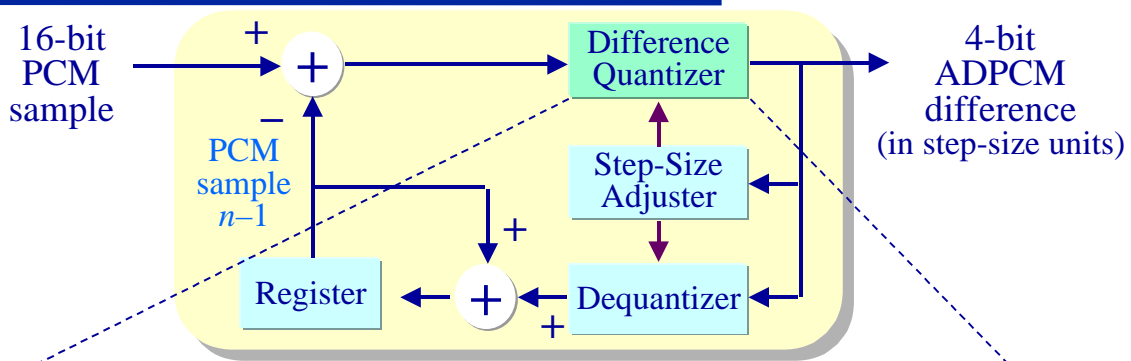

- ◆ Predictor is not adaptive and simply uses the last sample value
- ◆ Quantization step-size increases logarithmically with signal frequency

17

## IMA ADPCM

### Difference quantization

Quantization	Quantizer Output	Step-Size Multiples
$difference < \frac{1}{4} step\_size$	000	0.0
$\frac{1}{4} step\_size \leq difference < \frac{1}{2} step\_size$	001	0.25
$\frac{1}{2} step\_size \leq difference < \frac{3}{4} step\_size$	010	0.50
$\frac{3}{4} step\_size \leq difference < step\_size$	011	0.75
$step\_size \leq difference < \frac{5}{4} step\_size$	100	1.0
$\frac{5}{4} step\_size \leq difference < \frac{3}{2} step\_size$	101	1.25
$\frac{3}{2} step\_size \leq difference < \frac{7}{4} step\_size$	110	1.5
$\frac{7}{4} step\_size \leq difference$	111	1.75

18

# IMA ADPCM

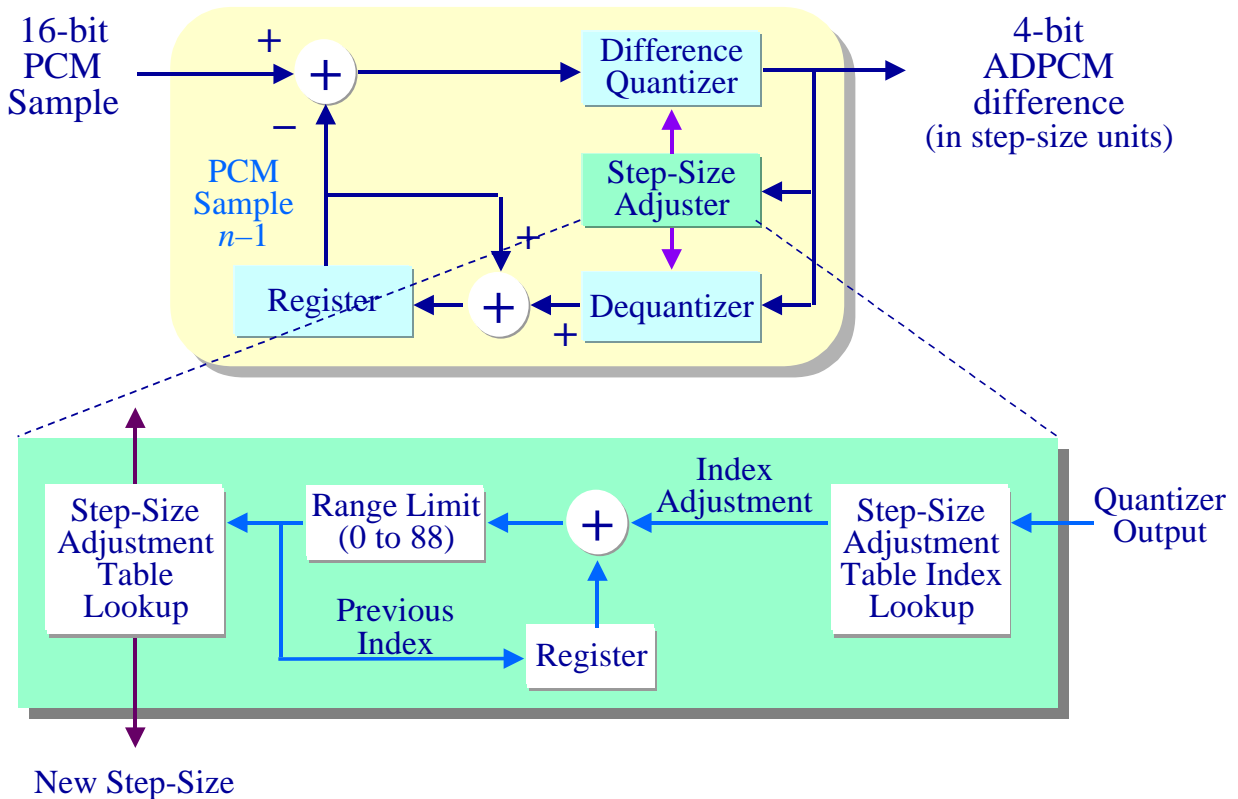

## Step-size adjustment table

19

# IMA ADPCM

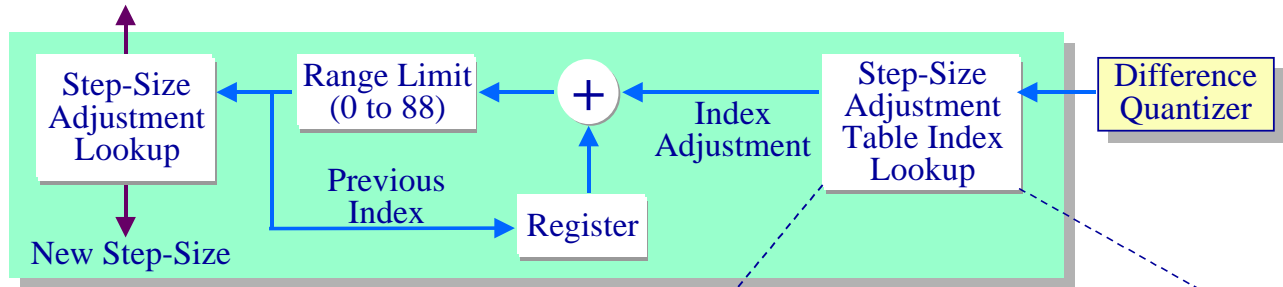

## Adaptive step-size selection

20

# IMA ADPCM

## Adaptive step-size selection

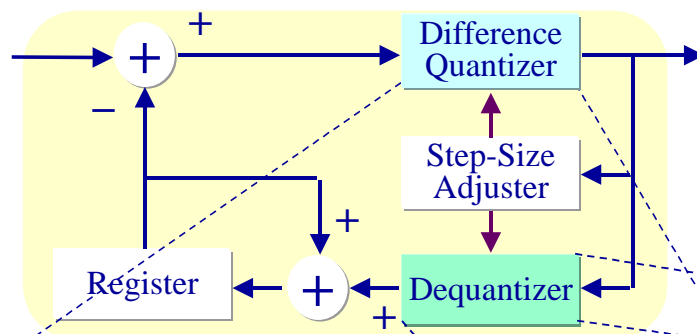

Quantization
$difference < \frac{1}{4} step\_size$
$\frac{1}{4} step\_size \leq difference < \frac{1}{2} step\_size$
$\frac{1}{2} step\_size \leq difference < \frac{3}{4} step\_size$
$\frac{3}{4} step\_size \leq difference < step\_size$
$step\_size \leq difference < \frac{5}{4} step\_size$
$\frac{5}{4} step\_size \leq difference < \frac{3}{2} step\_size$
$\frac{3}{2} step\_size \leq difference < \frac{7}{4} step\_size$
$\frac{7}{4} step\_size \leq difference$

Quantizer Output	Step-Size-Adjustment-Table Adjustment
000	-1
001	-1
010	-1
011	-1
100	2
101	4
110	6
111	8

21

# IMA ADPCM

## Dequantization

Input	Difference	Step Size	Quantizer output	Step-size multiplier	Reconstituted difference	Predicted value
X	$\Delta$	Step	Q	M	$\Delta$	Decode
150	5	7				
155	5	7				

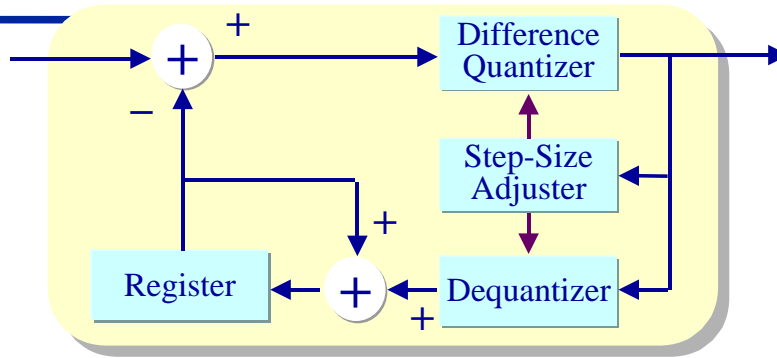

Quantization	Quantizer Output
$difference < \frac{1}{4} step\_size$	000
$\frac{1}{4} step\_size \leq difference < \frac{1}{2} step\_size$	001
$\frac{1}{2} step\_size \leq difference < \frac{3}{4} step\_size$	010
$\frac{3}{4} step\_size \leq difference < step\_size$	011
$step\_size \leq difference < \frac{5}{4} step\_size$	100
$\frac{5}{4} step\_size \leq difference < \frac{3}{2} step\_size$	101
$\frac{3}{2} step\_size \leq difference < \frac{7}{4} step\_size$	110
$\frac{7}{4} step\_size \leq difference$	111

Quantizer Output	Reconstituted Difference
000	0
001	$0.25 \times step\_size$
010	$0.50 \times step\_size$
011	$0.75 \times step\_size$
100	$1.0 \times step\_size$
101	$1.25 \times step\_size$
110	$1.5 \times step\_size$
111	$1.75 \times step\_size$

22

# IMA ADPCM

## Example

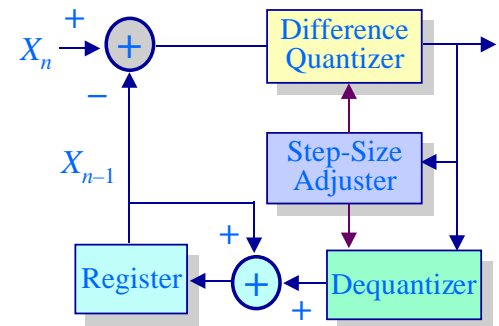

Quantization	Quantizer Output	Step-Size Table Adjustment	Step-Size Multiplier
$sample < \frac{1}{4} step\_size$	000	-1	0.0
$\frac{1}{4} step\_size \leq sample < \frac{1}{2} step\_size$	001	-1	0.25
$\frac{1}{2} step\_size \leq sample < \frac{3}{4} step\_size$	010	-1	0.50
$\frac{3}{4} step\_size \leq sample < step\_size$	011	-1	0.75
$step\_size \leq sample < \frac{5}{4} step\_size$	100	2	1.0
$\frac{5}{4} step\_size \leq sample < \frac{3}{2} step\_size$	101	4	1.25
$\frac{3}{2} step\_size \leq sample < \frac{7}{4} step\_size$	110	6	1.5
$\frac{7}{4} step\_size \leq sample$	111	8	1.75

23

# IMA ADPCM

## Example

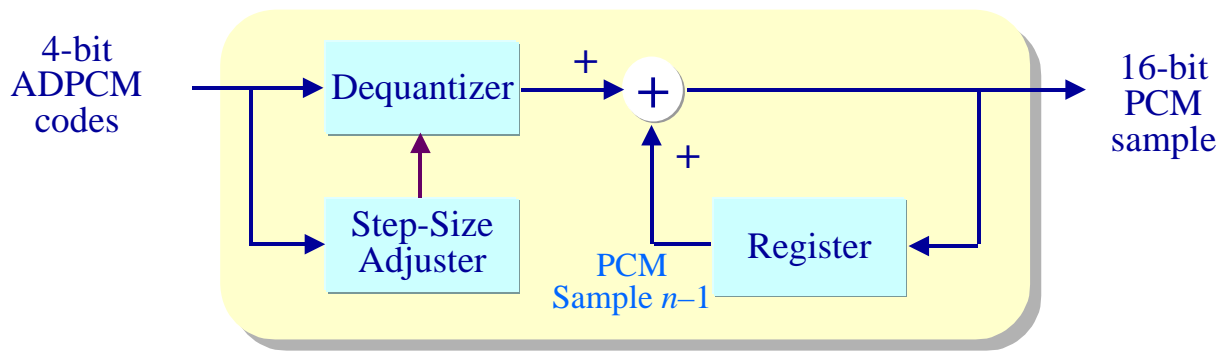

Input	Difference	Step Size	Quantizer output	Index Adjustment	SS adj. table index	Step-size multiplier	Reconstituted difference	Predicted value
X	$\Delta$	Step	Q	Adj	I	M	$\Delta$	Decode
150		7		0				150
155	5	7	010	-1	0	0.5	3.5	154
167								
170								
250								
250								
250

200								
200								

24

# IMA ADPCM

## Decoding

- ◆ Reconstitute the difference between samples and sum
  - » While adaptively adjusting the step-size
- ◆ What happens if code-word(s) are lost in the network?
  - » How does the decoder re-synchronize with the coder?

25

## Differencing Compression

### Networking considerations

- ◆ The IMA codec is reasonably robust to errors
  - » An interval with a low-level signal will correct any step-size error

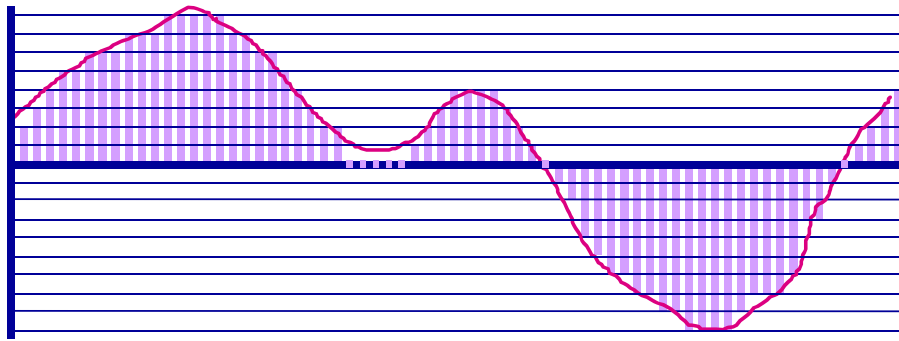

Quantization
$difference < \frac{1}{4} step\_size$
$\frac{1}{4} step\_size \leq difference < \frac{1}{2} step\_size$
$\frac{1}{2} step\_size \leq difference < \frac{3}{4} step\_size$
$\frac{3}{4} step\_size \leq difference < step\_size$
$step\_size \leq difference < \frac{5}{4} step\_size$
$\frac{5}{4} step\_size \leq difference < \frac{3}{2} step\_size$
$\frac{3}{2} step\_size \leq difference < \frac{7}{4} step\_size$
$\frac{7}{4} step\_size \leq difference$

Quantizer Output	Step-Size-Adjustment-Table Adjustment
000	-1
001	-1
010	-1
011	-1
100	2
101	4
110	6
111	8

26

# Differencing Compression

## Delta modulation

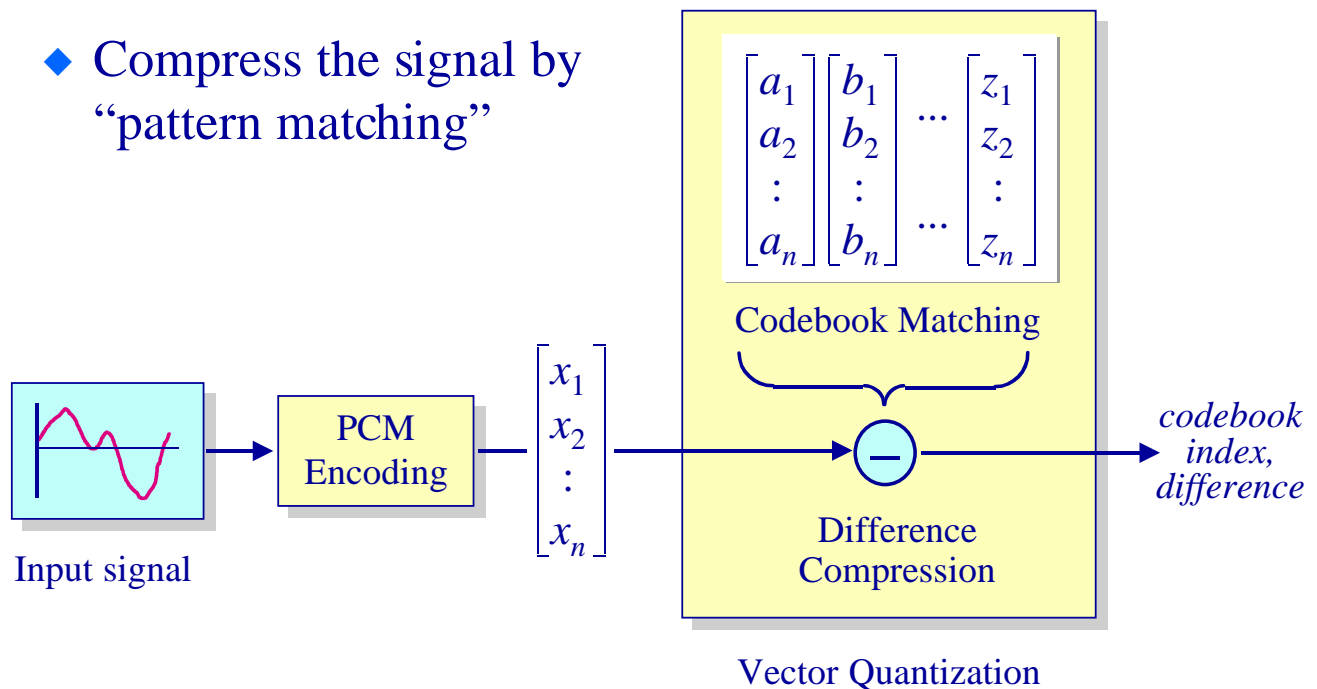

- ◆ Use a single bit to encode the difference between consecutive samples
  - » samples assumed to never change by more than 1 quantum
- ◆ Requires a much higher sampling rate (and small quantum) to work
  - » slope overload is much more serious

27

# Other Generic Compression Schemes

## Vector quantization

- ◆ Compress the signal by “pattern matching”

28

# Audio-Specific Compression Techniques

## $\mu$ -Law companding (ITU Rec. G.711)

- ◆ Non-linear quantization of the signal's amplitude
  - » Quantization step-size decreases logarithmically with signal level
  - » Low-amplitude samples represented with greater accuracy (more bits) than high-amplitude samples
  - » Humans are less sensitive to changes in “loud” sounds than “quiet” sounds

29

# Audio-Specific Compression Techniques

## $\mu$ -Law companding

- ◆ Provides 14-bit quality (dynamic range) with an 8-bit encoding
- ◆ Used in North American & Japanese ISDN voice service
- ◆ Simple to compute encoding

$$f(x) = 127 \times \text{sign}(x) \times \frac{\ln(1 + \mu|x|)}{\ln(1 + \mu)} \quad (x \text{ normalized to } [-1, 1])$$

30

# $\mu$ -Law Companding

## Example

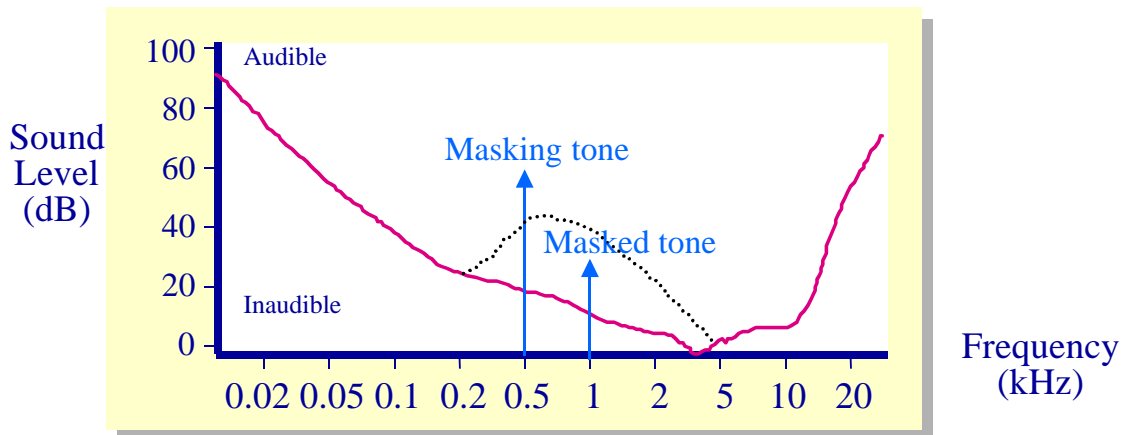

Input Amplitude	Step Size	Segment	Quantization	Code Value	Decode Amplitude
0-1	1		0000	0	0
1-3	2	000	0001	1	2
...			...	...	...
29-31			1111	15	30
31-35	4	001	0000	16	33
...			...	...	...
91-95			1111	31	93
95-103	8	010	0000	32	99
...			...	...	...
215-223			1111	47	219
223-239	16	011	0000	48	231
...			...	...	...
463-479			1111	63	471
...			...	...	...

31

## Audio-Specific Compression Techniques

### Auditory masking

- ◆ The presence of tones at certain frequencies makes us unable to perceive tones at other “nearby” frequencies
  - » Humans cannot distinguish between tones within 100 Hz at low frequencies and 4 kHz at high frequencies

32

# Audio-Specific Compression Techniques

## Subband coding

---

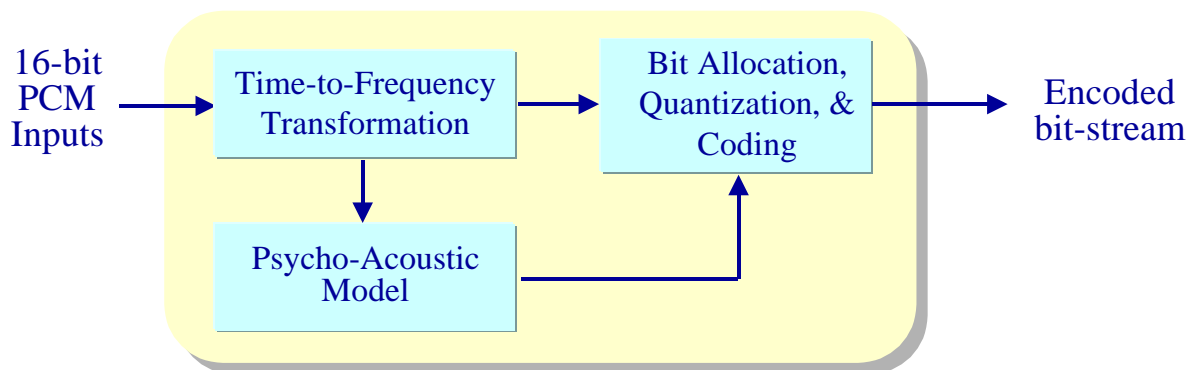

- ◆ Code signal based on degree of masking present in the signal
- ◆ Example: MPEG audio compression (Layer I)
  - » Stereo 16-bit audio sampled at 48 kHz (1.5 Mbps) compressed to 256 kbps (6:1)
  - » Perceptually lossless

33

## Subband Coding

### MPEG Audio

---

- ◆ Transform signal into the frequency domain
- ◆ Partition spectrum into 32 uniform subbands
- ◆ Sample from each subband according to a psycho-acoustic model
  - » Quantize samples according to the audibility of noise within the band & degree to which the band is masked by other bands

34

# Audio-Specific Compression Techniques

## Human speech-based coding (“Vo-coding”)

- ◆ Formant — frequency maxima & minima in the spectrum of the speech signal

35

# Audio-Specific Compression Techniques

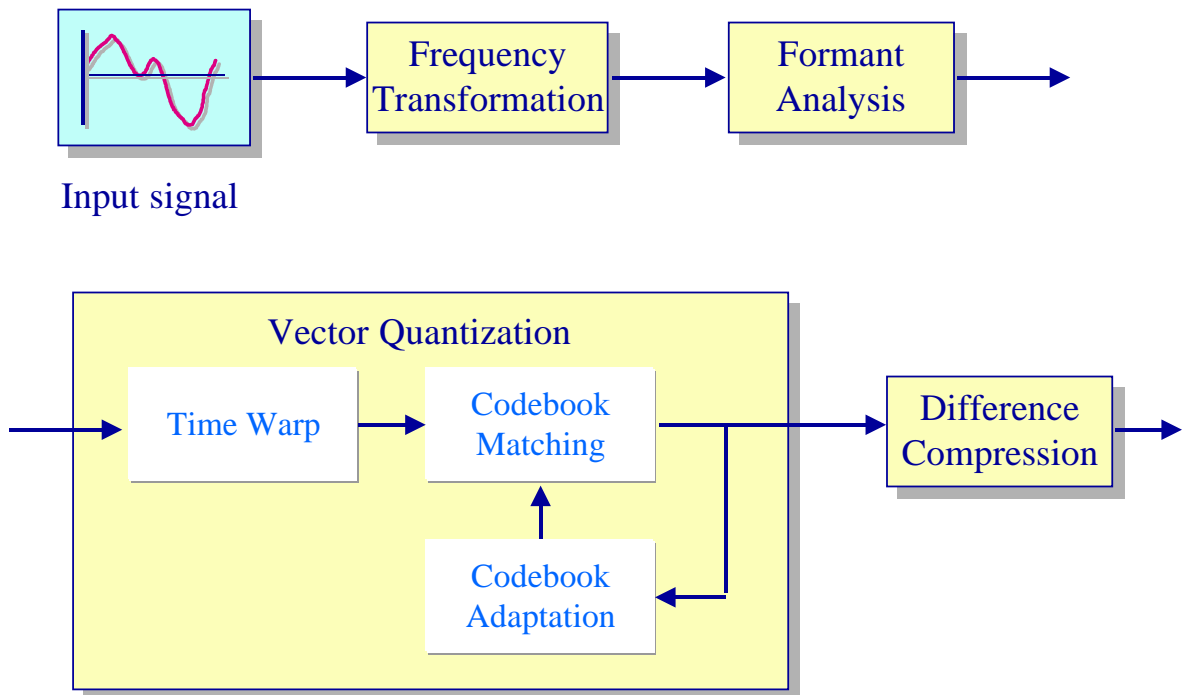

## Vocoding — Linear Predictive Coding

- ◆ Artificially generate speech via formant synthesis
  - » A mathematical simulation of the vocal tract as a series of bandpass filters
  - » Code and transmit filter coefficients
- ◆ Standards
  - » Regular Pulse Excited Linear Predictive Coder (RPE-LPC)
    - ❖ digital cellular standard GSM 6.1 (13 kbps)
  - » Code Excited Linear Predictive Coder (CELP)
    - ❖ US Federal Standard 1016 (4.8 kbps)
  - » Linear Predictive Coder (LPC)
    - ❖ US Federal Standard 1015 (2.4 kbps)

36

# Vocoding Example

## Code Excited Linear Predictive Coder (CELP)

37

# The Audio Data Type

## Summary

- ◆ Audio is more important than video
  - » And fundamentally less structured
- ◆ Generic compression principles
  - » Elimination of temporal redundancy
  - » Exploit commonly occurring patterns
- ◆ Audio-specific techniques
  - » Exploit human's insensitivity to changes in amplitude
  - » Exploit auditory masking
- ◆ Conclusions
  - » Never make quality assessments based on bit-rate alone!

38
