## **1 Introduction**

PolyMorpher is a game that will give computer science students a resource to help develop their object-oriented programming (OOP) skills. The player will begin as a wizard who has been caught inside a dungeon full of monsters and puzzles. The only way for the player to escape the dungeon is to use OOP skills to “hack” the environment.

### **1.1 Purpose**

The purposes of PolyMorpher are:

- Teach a basic understanding of abstraction and then have the user show the learned skill through application
- Teach a basic understanding of encapsulation and then have the user show the learned skill through application
- Teach a basic understanding of inheritance and then have the user show the learned skill through application
- Teach a basic understanding of polymorphism and then have the user show the learned skill through application
- Help the user develop problem solving skills
- Create a fun gaming experience for the user along with their learning experience

These purposes will be fulfilled through the player having to use various OOP skills to successfully escape the dungeon. This will be done through what will be referred to as hacking their environment. The player will be put through various puzzles where they will need to code scripts that require an understanding of encapsulation, abstraction, inheritance and polymorphism. These concepts will be taught to the player prior to their specific puzzles,

allowing the player to learn and then apply these skills in a gaming environment. It is important to note the PolyMorpher will not be teaching basic syntax and that players should be familiar with common concepts of programming languages such as types, functions, loops, and what an object is.

## **1.2 Scope**

Programming is intimidating for the uninitiated. As a result, first time ODU programming students drop out or switch majors. Existing tools fail to teach Object-Oriented Programming concepts and problem-solving skills. Object Oriented Programming is an essential skill for students to learn for them to do well in advanced level CS courses. However, at entry level courses students do not get taught OOP concepts which can lead not the result of changing majors or leaving college entirely.

The PolyMorpher prototype will contain an example level for each of the topics that will be taught in the complete version of PolyMorpher including abstraction, polymorphism, encapsulation, and polymorphism. Additionally, a tutorial will be included to teach the player the basic mechanics of how to play PolyMorpher as well as basic concepts the player will need to know in order to create scripts throughout the game. The topics included in the tutorial of game development be the game loop structure, triggers, and how to reference objects they see in the game in their scripts. The scripts the player creates will be attached to objects in the game which allows the player to “hack” their environment through coding.

PolyMorpher will be optimized for a 4th gen i3 Intel Processor. The minimal operating system needed for PolyMorpher will be Windows 7. These are the only two requirements needed as PolyMorpher will be a 2D game requiring minimal processing power or graphic processing

power. Customers will be able to obtain PolyMorpher by going to Team Silver's website, <http://www.cs.odu.edu/~411silver/>, and downloading the .exe file under the downloads tab.

### 1.3 Definitions, Acronyms, and Abbreviations

**API:** Application Program Interface

**Computer:** a programmable electronic device designed to accept data, perform prescribed mathematical and logical operations at high speed, and display the results of these operations

**Computer Programming:** a process that leads from an original formulation of a computing problem to executable computer programs

**Computer Science (CS):** the science that deals with the theory and methods of processing information in digital computers, the design of computer hardware and software, and the applications of computers

**Design:** an outline, sketch, or plan, as of the form and structure of a work of art, an edifice, or a machine to be executed or constructed

**Git:** version control system for tracking changes in computer files and coordinating work on those files among multiple people

**GitLab:** web-based git repository manager the includes wiki and issue tracking

**Gradle:** an open-source build automation system that was designed for multi-project builds

**GUI:** Graphical User Interface

**JavaScript:** a programming language commonly used in web development where the the code is processed by the client's browser

**Management Simulator:** a way to simulate the management of a game in an organized fashion

**MySQL:** an open source multi-user database management system

**Non-Technical Game:** user-friendly gameplay able to be utilized by non-technical users

**Non-Technical User:** user who lacks formal education or knowledge in computer science, computer programming, object-oriented programming, or problem solving skills

**Object-Oriented Programming (OOP):** A schematic paradigm for computer programming in which the linear concepts of procedures and tasks are replaced by the concepts of objects and messages

**ODU:** Abbreviation for Old Dominion University

**Platform:** an integrated set of packaged and custom applications tied together with middleware

**PolyMorpher:** a programming game that focuses strictly on teaching OOP and problem solving skills

**Problem Solving:** the process of finding solutions to difficult or complex issues

**Programming Game:** a video game which incorporates elements of computer programming into the game, which enables the player to direct otherwise autonomous units within the game to follow commands in a domain-specific programming language

**Regression Testing:** a type of application testing that determines if modifications to the application have altered the application negatively

**Software Development Kit (SDK):** a set of software development tools that allows the creation of applications for a certain software package

**Student Involvement:** the amount of physical energy students exert and the amount of psychological energy they put into their college experience

**Student Progression Dilemma:** the problem of CS majors at ODU not advancing through the CS course schedule in order to graduate with a CS degree

**TUI:** Tangible User Interface

**Ubuntu:** open-source Linux operating system

**Unity:** a popular game development platform

**User-Friendly:** easy to comprehend by non-technical users

**Virtual Machines:** emulations of computer systems that provide functionalities of physical computers

**Web Application:** a client-server computer program in which the client (including the user interface and client-side logic) runs in a web browser

**Wiki:** a website on which users collaboratively modify content and structure directly from the web browser

## **1.5 Overview**

This product specification provides the architecture description, functional description, external interfaces, capabilities and features of the PolyMorpher prototype. The following sections of this document include a detailed description of the software and external interface architecture of the PolyMorpher prototype; the key features of the prototype; the parameters used to control, manage, or establish said feature, and the performance characteristics of that feature in terms of output, displays, and user interaction.

## **2 General Description**

The goal of the PolyMorpher prototype is to provide insight into what the completed version of PolyMorpher would be like. The prototype will contain all the required pieces to make the final product but will not teach each topic as thoroughly as the final product will. It will however be playable from start to finish, giving players an understanding of the future product to come.

### **2.1 Prototype Architecture**

The PolyMorpher prototype will have a similar architecture to the final product of PolyMorpher. Figure 1 shows the architecture of the PolyMorpher prototype. As shown, the user will interact with a downloadable executable of the game, which they will download from Team Silver's website. The three main components of the prototype architecture are:

- PolyMorpher executable file which contains the game itself
- Unity file system containing the compiler as well as key files that work with the compiler that have been integrated into PolyMorpher to allow the player to code inside the game

- Team Silver Website which contains the executable file as well as will contain a forum, tips, and guides to complete PolyMorpher in the final product.

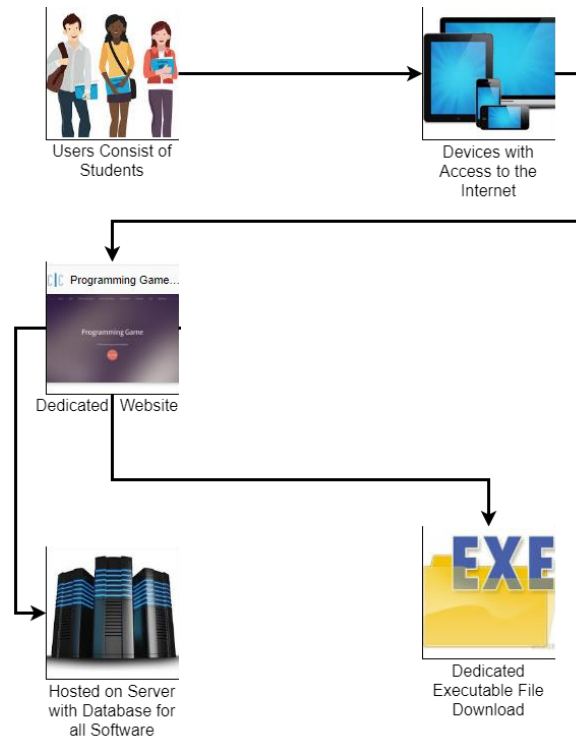

Figure 1. PolyMorpher Architecture.

## 2.2 Prototype Functional Description

The functions contained within the prototype can best be explained in Tables 1 and 2.

Together, Table 1 and Table 2 describe what will be in the PolyMorpher prototype and what has been removed from the PolyMorpher prototype.

KEY
Fully Functional
Partially Functional

Table 1. Key to Table 2

<b>Elements</b>	<b>Description</b>	<b>Real World Product</b>	<b>Prototype</b>
Teaches Polymorphism	Provision of a single interface to entities of different types		
Teaches Abstraction	Technique for arranging complexity of systems		
Teaches Encapsulation	Building of data with the methods that operate on that data		
Teaches Inheritance	When an object or class is based on another object or class, using the same implementation		
Single Language Taught	A single programming language will be focused on C#.		
Single Player	Focused on an experience targeted to interact with only one player		
Downloadable .EXE File	Desktop application version of the game		
Game Assets	Primary components that are used as building block to construct the more complex features and levels of the game		
Developed Story	Narrative used to drive progression or direct player throughout a more guided/linear experience		
Portable Compiler	Code compiler used to run player-made code on the fly in game		
Tutorial Section	Precursor series of levels meant to help the player adjust to the in-game toolset given to them and also prep them with knowledge of the language(s) they will be working with		
Multiple Platforms	Version support for multiple operating systems (Windows, Mac OS, Linux)		

Table 2. Summary of Prototype Functions and Capabilities

<b>Elements</b>	<b>Description</b>	<b>Real World Product</b>	<b>Prototype</b>
Sandbox Level	Open level where the player has access to all tools at once and can build their own level sequences and puzzles		
Player-Made Content	Variant of Sandbox Level, potentially allows the player to share custom levels with one another		
Multiple Player	An experience geared toward multiple players interacting with a game environment together		
Web Application	Web based version of the game running in-browser		
Multiple Languages Taught	Alternative programming languages for the player to use and learn in-game		

*Table 2. Summary of Prototype Functions and Capabilities*

As shown in Table 2, the .exe will contain the PolyMorpher game itself. The game will teach abstraction, inheritance, polymorphism, and encapsulation. Each topic will have one level in the PolyMorpher prototype to demonstrate what a potential level teaching each topic would look like. Due to each topic only having one level attributed to it in the prototype, each topic will only have one or two aspects taught.

The Unity file structure inside of PolyMorpher contains the compiler. The compiler will be used to allow the player to develop scripts, attach them to objects in the game, and have the game compile the player's scripts while running the game. It is this process which will be used to teach the player how to use the various topics of OOP they learn throughout the game.

For the prototype, the only thing the website will be used for is to download the .exe. If time permits there will also be a sandbox level where the player will be given free reign to develop as they please with all objects in the game.

## **2.3 External Interfaces**

The different external interfaces are the hardware interface, the software interface, the computer screen, mouse, and keyboard. The player will interact with these various interfaces in order to play PolyMorpher.

### **2.3.1 Hardware Interface**

The PolyMorpher prototype will be played on the player's local machine. The machine must have at least a fourth generation i3 Intel processor. There are no other requirements as PolyMorpher is a 2D game, therefore requiring minimal resources from the PC.

### **2.3.2 Software Interface**

Due to the PolyMorpher prototype being a standalone executable file, the only software interface will be the operating system that PolyMorpher runs on. PolyMorpher will be able to run on Windows, macOS, as well as Linux.

### **2.3.3 User Interfaces**

There are three primary user interfaces that will be used while playing PolyMorpher which include:

- **Computer screen:** The computer screen will be used to show the player the game. The player will be given information via the computer screen. This can be any computer screen due to PolyMorpher having minimal resource requirements.
- **Computer mouse:** The computer mouse will be used by the player in order to decide which objects to "hack", to click on a variety of buttons, as well as to move from one level to the next. There are no specific requirements to which computer mouse must be used to play PolyMorpher.

- Computer keyboard: The computer keyboard will be used by the player to create scripts and to control the main character. There are no specific requirements to which computer keyboard must be used to play PolyMorpher.
