

You will create a backend for organizing data for a store. This program will be tested using only your objects and their methods / member functions using a driver program provided.

Requirements

Based on the provided UML diagram (see following [slides](#) to learn more about UML) of the class Product, create the followings:

- Create a class for Product and include all the fields (data members) as indicated in the UML diagram.
- Implement all the member methods as indicated in the UML diagram.
 - void addShipment(int shipmentQuantity, double shipmentCost)
 - Add shipmentQuantity to inventory and increase totalCost by shipmentCost. Do not replace totalCost, just increase its value.
 - Your program should catch negative shipment quantity and negative shipment costs.
 - double getPrice()
 - This function will calculate the current price based on the average cost per item over time plus a 25% markup.
 $price = (totalCost / (inventory + numberSold)) * 1.25$
 - void processOrder(int Quantity);
 - If there is not enough inventory, display a message that there is no enough items in inventory. Otherwise, decrease inventory by quantity and increase numSold by quantity.
 - Your program should catch negative quantity entries.

- Make sure you have your name and Bronco ID at the top of your code

```

/* Name: Jane-Joe
 * Bronco ID: 12345678
 * Jon Doe helped me with.....
 */
    
```

- For the given [StoreDriver.java](#) your program should display the following output,

```

New Guava shipment arrives!
Guava costs $0.31
Guava current inventory is 38 after 12 sold
New Guava shipment arrives!
Guava costs $0.30
Guava current inventory is 98 after 32 sold

-----
New Gala Apple shipment arrives!
Gala Apple costs $0.38
Gala Apple current inventory is 72 after 28 sold
New Gala Apple shipment arrives!
Gala Apple costs $0.32
Gala Apple current inventory is 267 after 68 sold
    
```

Due: November 15, 2017 by 6.00 PM. submit your Product.java file to Blackboard.

Total Points = 100

- Code complies to requirements: 70 points
- Good coding style: 20 points
- Correctness/Robustness: 10 points
